## Group 2 Sprint 2 Progress Report

### Tab Name and Icon change:

For the Tab Name, after some research, we first set it using a vue mixin, since we couldn't seem to find where it was being set in the frontend. We weren't very satisfied with this solution however, because the tab name would say "Vue App" until the very last second of loading, at which point it would change from our mixin. After a lot of trial and error, we found out that Vue wanted to have a directory called public inside of our frontend folder, so we created that and an index.html that is supposed to be there. Our index.html is based off of the template created by Vue's CLI. When we set the title on this particular index.html, it would directly affect the webpage, so we went ahead and did the icon as well. We used the image titled 'logowithoutletters.png' which we found in augurface's files, since it seems to be intended to be used as the icon there.

We noticed there were several files in the /frontend/src/assets directory that didn't seem to actually be used, such as an index.html file. We weren't sure if this file was intended to be used as the main index.html file; if so, it is either in the wrong location or Vue's config needs to be modified to use that file.

There were a lot of unused images in the assets directory, in folders called content management and avatars, so we got rid of those.

Repo button: We looked into the issues with buttons not directing the user where they are expected to, and it looks to be a much more nasty issue than we initially thought, so we are putting this on the backburner for now while we work on the insights page. We will look into this issue more during sprints 3 and 4.

Insights: We have started to familiarize ourselves with the vuex actions related to Insights, and are hopeful that we will be able to make solid progress towards this by next sprint.
